

Name:	Planetarium
Summary:	The planetarium web site provides a way to display a list of our solar system planets and retrieve further details about it by redirecting the user to a dedicated page
Version:	1.0
Preconditions:	N/A
Triggers:	Landing on homepage and selecting an item
Main Success Scenario:	<ol style="list-style-type: none"> 1. User lands on the homepage index.jsp and selects one of the planets from the list 2. The request is forwarded to the servlet, which returns an output.jsp page containing more details and a picture of the planet selected 3. User can click on the image to be redirected on a Wikipedia page related to the planet selected 4. User goes back to the homepage through the button at the bottom of the output.jsp page to perform a new selection 5. The servlet returns a new output.jsp containing information about the new planet selected
Alternative Success Scenarios:	N/A
Postconditions:	N/A
Business Rules:	N/A
Notes:	1. The website is supported by all desktop and mobile browser that support <i>flexbox</i> as box model
